SUPPLEMENTAL AMENDMENT UNDER 37 C.F.R. § 1.114(c)Attorney Docket No.: Q88662

Application No.: 10/540,513

AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions and listings of claims in the

application:

LISTING OF CLAIMS:

(currently amended): A compound semiconductor epitaxial substrate for use in a

strain channel high electron mobility field effect transistor, comprising an InGaAs layer as a

strain channel layer and an AlGaAs layer containing n-type impurities as an electron supplying

layer, wherein said InGaAs layer has an electron mobility at room temperature of 8300 cm²/V·s

or more,

wherein GaAs layers having a thickness of 4 nm or more each are laminated respectively

in contact with a top surface and a bottom surface of said strain channel layer;

wherein said GaAs layer in contact with the bottom surface of said strain channel layer is

a spacer layer.

2. (original): The compound semiconductor epitaxial substrate according to claim 1,

wherein the InGaAs layer constituting said strain channel layer has an In composition of 0.25 or

more.

3. (canceled)

4. (withdrawn): A method for manufacturing the compound semiconductor epitaxial

substrate according to claims 1 or 2, comprising epitaxially growing the layer of each compound

semiconductor by employing a metalorganic chemical vapor deposition (MOCVD) method.

2

SUPPLEMENTAL AMENDMENT UNDER 37 C.F.R. § 1.114(c)Attorney Docket No.: Q88662 Application No.: 10/540,513

- 5. (withdrawn): The method according to claim 4, wherein the InGaAs layer is epitaxially grown as the strain channel layer such that the In composition thereof becomes 0.25 or more, the AlGaAs layer containing n-type impurities is epitaxially grown as the electron supplying layer, and GaAs layers are each epitaxially grown to a thickness of 4 nm or more respectively in contact with a top surface and a bottom surface of said strain channel layer.
- 6. (previously presented): The compound semiconductor epitaxial substrate according to claim 1, wherein said GaAs layer laminated in contact with the top surface of said strain channel layer is a non-doped layer.
